<b>13. ABSTRACT (Maximum 200 words)</b> A surface pressure altitude (SPA) prediction model has been developed that is totally empirical and based on SPA data from 556 meteorological observation stations in the free world. This model is simple and can be executed very quickly on a microcomputer.  The model estimates the mean SPA perturbation (SPAP) or difference between the SPA and the surface elevation of a station by a sum of numbers that represent the additive effects of month, time of day, station location, interaction of month with station location, interaction of time of day with station location, and an additive constant. A prediction of SPA at a later time is made by taking the current SPA and adding the difference between the modelled mean SPAP for the later time and the modelled mean SPAP at the current time.  The model predicts SPA well in the near term at an observing site when the current SPA is known. The quality of the prediction decays with prediction lay time until about 50 percent of actual SPA variation is accounted for by the predicted SPA at a lag time of 24 h.

## 1. INTRODUCTION

The U.S. Army Atmospheric Sciences Laboratory (ASL) has a requirement to develop a surface pressure altitude (SPA) prediction model for the AirLand Battlefield Environment Advanced Technology Demonstration Program and the Integrated Meteorological System. This model is to be used by staff weather officers to provide estimates of SPA over a 24-h period for aviation mission planning. Aircraft performance is significantly affected by SPA.

The model cannot be theoretically elaborate and based on complete physics of the atmosphere because of constraints in computer power and the need for quick computer execution. The SPA prediction model presented in this report is simple and executes very quickly. It can be implemented on any microcomputer using the Microsoft MS-DOS version 2.0 or higher operating system as well as any larger computer.

This SPA model is strictly empirical rather than based on a theoretical meteorology foundation. It is built entirely from statistics of SPA data from 556 locations in the free world.

## 2. DATABASE AVAILABLE

ASL has a database of historical meteorological surface observations from most geographical areas of the free world. This database was provided by the U.S. Air Force Environmental Technical Applications Center from their operating location at Ashville, North Carolina (USAFETAC, OL-A). The period of record from each station is approximately 11 yr or more. The data were ordered from USAFETAC by geographical region and country over several years. This lag in ordering the data results in the periods of record for the stations ranging from 1966 to 1976 in Northern and Central Europe and from 1973 to 1986 in the United States and Canada, depending on when the data were requested.

Only the 3-hourly surface observations (those recorded at 0000, 0300, ..., 2100 G.m.t. were used in developing the model since these are the observations that contain station pressure required to get SPA. These historical observations were screened and obvious erroneous entries were deleted. Some questionable data was accepted as valid and some discarded. This was a subjective decision by the author based on the location and elevation of the station and the similarity of data at other stations in the vicinity.

Since SPA is not included in the historical data as an observed parameter, it had to be computed from the station pressure. The hydrostatic equation and the equation of state for an ideal gas from the 1962 U.S. Standard Atmosphere\* were used to get the relationship between station pressure and SPA.

---

\*U.S. Committee on Extension to the Standard Atmosphere, 1962, *U.S. Standard Atmosphere, 1962*, Superintendent of Documents, U.S. Government Printing Office, Washington, D.C.

Combining the hydrostatic equation

$$dP = - \rho g dZ \quad (1)$$

and the equation of state for an ideal gas

$$\rho = \frac{P}{RT} \quad (2)$$

gives

$$\frac{dP}{P} = - \frac{g dZ}{RT} \quad (3)$$

where  $P$  is the atmospheric pressure in newtons meter<sup>-2</sup>,  $T$  is the temperature in degrees kelvin,  $\rho$  is the density in kilograms meter<sup>-3</sup>,  $g$  is the acceleration due to gravity in meters second<sup>-2</sup>,  $Z$  is the geometric height in meters, and  $R$  is a gas constant with units joules kilogram<sup>-1</sup> kelvin<sup>-1</sup>.

In the lower part of the atmosphere below 10 km where all the observing stations are located, the 1962 Standard Atmosphere presents the standard temperature as decreasing at a constant rate with increasing height. That is,

$$T(Z) = T_0 (1 + \gamma Z) \quad (4)$$

gives very close agreement to the standard atmosphere temperatures where  $T_0$  is 288.15 K and  $\gamma$  is  $-2.25222974 \times 10^{-5} \text{ m}^{-1}$ . Replacing  $T$  by  $T(Z)$  in equation (3) gives

$$\frac{dP}{P} = - \frac{g}{RT_0} \frac{dZ}{(1 + \gamma Z)} \quad (5)$$

Integrating this equation produces the result

$$\frac{P_z}{P_0} = (1 + \gamma Z)^{-\frac{g}{R\gamma T_0}} \quad (6)$$

where  $P_z$  is the standard atmosphere pressure at height  $Z$  above mean sea level (msl) in meters and  $P_0$  is the standard pressure at msl (101325 newtons m<sup>-2</sup> or 1013.25 mbar).

Solving this equation for  $Z$  in terms of  $P_z$  gives the relationship

$$Z = \frac{1}{\gamma} \left[ \left( \frac{P_z}{P_0} \right)^{-\frac{RT_0\gamma}{g}} - 1 \right] . \quad (7)$$

Given the atmospheric surface pressure at a station,  $P_s$ , this equation can be used to find the SPA,  $Z_p$ . That is,

$$Z_p = \frac{1}{\gamma} \left[ \left( \frac{P_s}{P_0} \right)^{-\frac{RT_0\gamma}{g}} - 1 \right] . \quad (8)$$

The exponent has a numerical value given by

$$-\frac{RT_0\gamma}{g} = 0.1902636 ; \quad (9)$$

therefore,

$$Z_p = 44400 \left[ 1 - \left( \frac{P_s}{1013.25} \right)^{0.1902636} \right] \quad (10)$$

for  $Z_p$  in meters msl and  $P_s$  in millibars.

The SPA was computed for every 3-hourly observation that had a corresponding station pressure reported. A station had to have more than 1000 station pressure observations to be accepted. There were 699 stations with a sufficient number of station pressure records available for analysis and modelling. The times of all observations were converted from G.m.t. to correspond as closely as possible to 3-hourly local solar time (LST). The new 3-hourly time periods were 0000, 0300, ..., 2100 LST.

### 3. STATISTICAL EDITING PROCEDURE

A second editing procedure was required to determine those stations whose SPA were unrealistic compared to similar data from other stations in the vicinity. To standardize the computed SPA values for between station comparisons, the corresponding station elevation was subtracted from the SPA computed for each observation. The resultant data used in the analysis of the SPA were these SPAP from each station.

Some erroneous historical observations of station pressure caused unrealistic variations between consecutive values of SPAP. For this editing procedure the mean values of the SPAP for each month, 3-hourly time period, and station were computed. The acceptable database was pruned further because of this requirement for mean values. Any station that had less than 6 observations for each of the 96 combinations of month and 3-hourly time period was eliminated from the SPA

database. Since several stations had daytime observations only, this pruning left 576 stations with SPA data to be analyzed.

The mean values of SPAP were edited and analyzed by using a statistical analysis of variance model

$$X_{ijk} = \mu + a_i + b_j + c_k + d_{ik} + f_{jk} + e_{ijk} , \quad (11)$$

where  $X_{ijk}$  was the mean SPAP for month  $i$  ( $i = 1, 2, \dots, 12$ ), 3-hourly LST time period  $j$  ( $j = 1, 2, \dots, 8$ ), and station  $k$  ( $k = 1, 2, \dots, 576$ );  $\mu$  was the constant effect for all the SPAP;  $a_i$  was the effect due to month  $i$ ;  $b_j$  was the effect due to 3-hourly LST time period  $j$ ;  $c_k$  was the effect of station location  $k$ ;  $d_{ik}$  was the effect due to interaction between month  $i$  and station location  $k$ ;  $f_{jk}$  was the effect due to the interaction between 3-hourly LST time period  $j$  and station location  $k$ ; and  $e_{ijk}$  was the contribution to the SPAP for month  $i$ , 3-hourly period  $j$ , and station  $k$  that was unaccounted for by the other effects. Typically,  $e_{ijk}$  would be called noise and assumed to be random and uncorrelated. For editing purposes this assumption was not necessary. The  $e_{ijk}$  were merely effects that were not modelled. All variables in the model except  $X_{ijk}$  were unknown.

The unknown variables were estimated from the mean SPAP data by using the equations

$$\mu = X_{...} , \quad (12)$$

$$a_i = X_{i..} - X_{...} , \quad (13)$$

$$b_j = X_{.j.} - X_{...} , \quad (14)$$

$$c_k = X_{..k} - X_{...} , \quad (15)$$

$$d_{ik} = X_{i.k} - X_{i..} - X_{..k} + X_{...} , \quad (16)$$

$$f_{jk} = X_{.jk} - X_{.j.} - X_{..k} + X_{...} , \quad (17)$$

$$\epsilon_{ijk} = X_{ijk} - X_{i..k} - X_{.jk} + X_{...k} \quad (18)$$

where the dot subscript indicates an average over the corresponding subscript index. For example,  $X_{...k}$  was computed by summing the SPAP means over the month index,  $i$ , and the 3-hourly period index,  $j$ , and dividing by 96 as indicated by the equation

$$X_{...k} = \frac{\sum_{i=1}^{12} \sum_{j=1}^8 X_{ijk}}{(12)(8)} \quad (19)$$

The noise or residuals,  $\epsilon_{ijk}$ , were examined in detail to identify stations whose mean SPAP data were extremely noisy and unrealistically volatile compared to other stations in the vicinity. Similarly, the effects due to interaction of month and station location,  $d_{ik}$ , and effects due to interaction of 3-hourly period and station location,  $f_{jk}$ , were carefully examined for gross outliers. After the stations with unacceptable SPAP means were eliminated, the final SPA data set contained 556 stations with 14,516,673 SPA values. Appendix A lists these stations and their station numbers, latitudes, longitudes, and elevations.

#### 4. SURFACE PRESSURE ALTITUDE PERTURBATION PREDICTION MODELS

Several elaborate models were tried in an effort to develop a good SPAP prediction model using the known current and past meteorological parameters. Most of these models gave very poor results and will not be described in this report. The following models describe the simpler and surprisingly best approaches.

##### 4.1 Using Current Surface Pressure Altitude Perturbation

A simple preliminary model for SPAP prediction was to assume the values over the next eight 3-hourly time periods could be determined by the current value. This model will perform very well if SPA is a first-order Markov process. Mathematically,

$$Y_{ij+tk} = A_{ij+tk}(Y_{ijk} - X_{ijk}) + X_{ij+tk} \quad (20)$$

where  $Y_{ijk}$  was the current SPAP for month  $i$ , 3-hourly period  $j$ , and station  $k$ ;  $Y_{ij+tk}$  was the predicted SPAP  $t$  ( $t = 1, 2, \dots, 8$ ) 3-hourly periods later;  $A_{ij+tk}$  was an unknown coefficient; and  $X_{ijk}$  and  $X_{ij+tk}$  were the mean SPAP currently and  $t$  3-hourly periods later. Linear regression analysis was used to determine the unknown coefficients by using the individual SPAP data values from the entire period of record for each station.

The computed values of  $A_{ij+tk}$  tended to be in the range 0.9 to 1.02 for  $t = 1$  and dropped off gradually to the range 0.6 to 0.8 for  $t = 8$  regardless of the values

of  $i$ ,  $j$ , and  $k$ . This prediction model did well in predicting SPAP up to 24 h later, but not well enough to be eagerly accepted.

#### 4.2 Using Current Surface Pressure Altitude Perturbation and Temperature

The next prediction model added another unknown coefficient,  $B_{ij+tk}$ , to the previous model to consider the influence of the difference between the current temperature,  $T_{ijk}$ , and its mean value in predicting the SPAP at a later time. Regression was used to solve for the unknown coefficients.

The coefficients for current temperature,  $B_{ij+tk}$ , varied greatly from one time period to another, from one month to another, and from one station to another. They slightly affected the previously computed  $A_{ij+tk}$  values. Unfortunately, this model demonstrated very little improvement (generally less than 2 m) over the model using current SPAP only.

#### 4.3 Using Current and Past Surface Pressure Altitude Perturbations

The next prediction model removed the temperature term from the previous model and replaced it with the term  $B_{ijk} (Y_{ij-1k} - X_{ij-1k})$ .  $B_{ijk}$  was an unknown coefficient and  $Y_{ij-1k}$  and  $X_{ij-1k}$  were the SPAP for the 3-hourly time period  $j-1$  and its mean value, respectively. Regression was used to solve for the unknown coefficients.

The coefficients  $A_{ijk}$  tended to be about twice as large as they were in the first model using current SPAP only. The  $B_{ijk}$  tended to be close to the negative of the  $A_{ijk}$ . Since consecutive SPAP tend to be highly correlated, this effect on the coefficients was expected. There was expectation that there might still be significant improvement in the prediction capability of the model if the SPA happens to be a second-order Markov process. This expectation proved to be wrong. This prediction model made less improvement than the previous model using the temperature term.

#### 4.4 Using Current Surface Pressure Altitude Perturbation with Known Coefficient

The next model to be tried was the same as the first model using current SPAP only, but with the coefficients  $A_{ijk} = 1$  for all  $i$ ,  $j$ , and  $k$ . The results were surprising. This model added less than 1 m to the prediction error at  $t = 1$  and usually less than 5 m to the prediction error at  $t = 8$ . These general results held for all months, 3-hourly periods, and stations.

These results mean that a reasonably good prediction of SPAP at some  $t$  3-hourly periods later can be obtained by taking the difference between the current SPAP and its mean and adding this difference to the mean SPAP  $t$  periods later.

### 5. MODELLING MEAN SURFACE PRESSURE ALTITUDE PERTURBATION

Setting the coefficients  $A_{ijk} = 1$  in the first SPAP prediction model given by equation (20) means

$$Y_{ij+ck} = Y_{ijk} + (X_{ij+ck} - X_{ijk}) \quad (21)$$

Because  $Y_{ijk}$  would be observed or computed from observed station pressure and known station altitude, the problem in getting a reasonable prediction for SPAP for some future 3-hourly period was reduced to having the mean SPAP values available. Because of the number of stations involved and the need to keep the data storage file small for ALBE and IMETS, an attempt was made to model the mean SPAP,  $X_{ijk}$ , rather than store the entire set of mean SPAP values.

There is an obvious diurnal effect on station pressure. Therefore, the  $X_{ijk}$  values were subjected to a harmonic analysis or Fourier series curve fit with sinusoids of periods 24, 12, and 6 h. The results were disappointing. The amplitudes and phase angles varied wildly between stations within the same vicinity. There were no consistent diurnal sinusoid periods to be found in the SPAP means.

Because of the seasonal effect on station pressure, the  $X_{ijk}$  values were given a harmonic analysis with sinusoids of periods 12, 6, 4, 3, and 2 mo. Again, the results were disappointing. The amplitudes and coefficients were quite variable between stations in the same vicinity. There were no consistent seasonal sinusoid periods to be found in the SPAP means.

The values of  $\epsilon_{ijk}$  determined by equation (18) were examined. The values did not demonstrate any recognizable diurnal or seasonal characteristics or trends and appeared chaotic and fairly random. There was no recognizable similarity in the corresponding values between stations. These results were expected because of the definition of  $\epsilon_{ijk}$ .

The mean values of  $a_i$ ,  $b_j$ ,  $c_k$ ,  $d_{ik}$ ,  $f_{jk}$ , and  $\epsilon_{ijk}$  are zero. Table 1 lists the values of  $\mu$ ,  $a_i$ , and  $b_j$ . The standard deviations of  $a_i$  and  $b_j$  are 14.468 m and 4.840 m, respectively. Appendix B lists the values of  $c_k$ ,  $d_{ik}$ , and  $f_{jk}$  for each of the 556 stations. The values of  $c_k$  range from 100.134 to 158.174 m with a standard deviation of 28.384 m,  $d_{ik}$  ranges from -81.502 to 143.636 m with a standard deviation of 22.198 m, and  $f_{jk}$  ranges from -35.704 to 41.567 m with a standard deviation of 5.438 m. The standard deviation of  $\epsilon_{ijk}$  was 4.173 m. By comparison, the standard deviation of the SPAP mean values between the 556 stations was 28.74 m. The standard deviation of  $\epsilon_{ijk}$  is only one seventh of the standard deviation of the SPAP means.

These results indicate that the mean values of SPAP,  $X_{ijk}$ , for each month, 3-hourly time period, and station location can be estimated with acceptable accuracy from equation (11) by deleting the  $\epsilon_{ijk}$  term. The resulting model is

$$X_{ijk} = \mu + a_i + b_j + c_k + d_{ik} + f_{jk} \quad (22)$$

with an error standard deviation of a little more than 4 m. This was the model selected for estimating mean SPAP.

TABLE 1. VALUES FOR THE MODEL EFFECTS ATTRIBUTED TO THE CONSTANT, MONTH, AND 3-HOURLY LOCAL SOLAR TIME PERIOD

---

Constant ( $\mu$ ) = -10.516 m		
Month ( $a_i$ for $i = 1, 2, \dots, 12$ )		
Jan = -22.326 m	May = 16.082 m	Sep = 1.641 m

## 6. SURFACE PRESSURE ALTITUDE MODEL

The final SPA prediction model is obtained by adding the known station elevation to the predicted values of SPAP from equation (21) after using equation (22) to determine the values of  $X_{ijk}$  and  $X_{ij+tk}$ .

If  $H_{ijk}$  and  $H_{ij+tk}$  represent the current observed SPA during 3-hourly period,  $j$ , and the predicted SPA at  $t$  3-hourly periods in the future,  $j + t$ , during the same month,  $i$ , and at the same station location,  $k$ , then

$$H_{ij+tk} = H_{ijk} + [(b_{j+t} - b_j) + (f_{j+tk} - f_{jk})]. \quad (23)$$

The subscript  $j+t$  in the equation is to be treated in a cyclic manner such that if  $j+t$  is greater than 8, then subtract 8 from its value. For example,  $j+t = 9$  gives  $j+t = 1$ ,  $j+t = 10$  gives  $j+t = 2$ , and so forth.

This model was tested and predicted SPA reasonably well over the next 24 h at a station when the current SPA was known. To test the model, each SPA value taken at a station was used to predict the SPA for the next eight 3-hourly periods. These predicted values were compared with the actual SPA values that occurred. The results indicated that observation time period was not relevant to the predicted value error statistics. Month had some effect on the predicted value error statistics and station location had the most impact. These variations, however, were relatively insignificant. Differences in error standard deviations were generally less than 5 m.

Table 2 shows the pooled results from using the model on data from 23 stations selected at random from the 556 stations available. This table shows the number of observations used in the test, mean and standard deviation of the actual SPAP,

mean and standard deviation of the SPA prediction errors, and the ratio of SPA prediction error variance to the actual SPAP variance. These values are available for each of eight 3-hourly prediction lag periods. The results indicate the model does quite well for near-term predictions but becomes progressively worse as the prediction lag time increases. This simple model can account for roughly 50 percent of the SPAP variance with a 24-h prediction of SPA.

TABLE 2. SURFACE PRESSURE ALTITUDE PREDICTION ERROR STATISTICS

Lag	Obs	SPAP Avg	Res Avg	SPAP Std	Res Std	Ratio
3	488627	-20.73	0.00	74.27	11.11	0.02
6	487209	-20.77	-0.01	74.28	19.28	0.07
9	486343	-20.77	-0.02	74.30	26.86	0.13
12	485971	-20.80	-0.03	74.31	33.66	0.21
15	485957	-20.81	-0.03	74.32	39.67	0.28
18	486340	-20.79	-0.04	74.32	44.99	0.37
21	486862	-20.78	-0.03	74.30	49.70	0.45
24	486501	-20.78	-0.04	74.30	53.89	0.53

Lag - the number of hours between observation time and prediction time

Obs - number of surface pressure altitude observations available

SPAP - actual surface pressure altitude perturbation

RES - predicted surface pressure altitude error or residual

Std - standard deviation (meters)

Avg - Mean value (meters)

Ratio - ratio of residual variance to actual surface pressure altitude perturbation variance

This model can be used to predict SPA at a location other than the observation site. Let  $H_{ijk}$ ,  $H_{iju}$ ,  $Z_k$ , and  $Z_u$  be the current SPA at station  $k$ , predicted current SPA at another site  $u$ , elevation at station  $k$ , and elevation at site  $u$ , respectively. The prediction model is given by

$$H_{iju} = H_{ijk} + [(\bar{c}_u - c_k) + (\bar{d}_{iu} - d_{ik}) + (\bar{f}_{iu} - f_{ik})] + (Z_u - Z_k) \quad , \quad (24)$$

where the bars over  $c_u$ ,  $d_{iu}$ , and  $f_{iu}$  indicate weighted averages of the corresponding values from other stations in the vicinity of site  $u$ , which may be available from the 556 stations contained in the data base.

The weighted average should use weights that give high contributing value to stations near site  $u$  and less value to those farther away. One should take care to allow for terrain effects in selecting the stations to be used in computing

the averages. Stations with grossly different elevations may not be very compatible regarding SPA similarities. This model will work reasonably well over flatlands or low rolling hills, but may not perform very well in mountainous terrain.

This model was tested by using SPA data from stations within a 100-km radius of stations that had SPA data available for comparison. The results indicate the errors in predicted SPA have a root-mean-square of from 10 to 50 m over flatlands and low rolling hills, depending on how close the other stations are to the test station. The effect of mountainous terrain on the errors in prediction was not tested because enough station configurations with sufficient data were not available.

In addition to short-term SPA prediction, the climatological mean SPA can be estimated for any month,  $i$ , and 3-hourly time period,  $j$ , for any of the 556 stations,  $k$ , from the model

$$H_{ijk} = \mu + a_i + b_j + c_k + d_{ik} + f_{jk} + Z_k \quad (25)$$

## 7. CONCLUSIONS

An SPA prediction model has been developed that is totally empirical and based on 14,516,673 SPA values from 556 stations in the world. It is simple and can be executed very quickly on a microcomputer.

The model predicts SPA well in the near term (error standard deviation of about 10 m at 3 h lag time) at an observing site when the current SPA is known. The quality of the prediction decays with prediction lag time until about 50 percent of actual SPA variation is accounted for by the predicted value at a lag time of 24 h (error standard deviation of about 50 m).

The model can be used to predict SPA at a site where surface pressure is not observed if there are stations in the vicinity of the database. The error in predicted SPA for such a site can range from 10 to 50 m if the terrain is flatlands or low rolling hills. The model may give greater errors in predicted values in mountainous terrain.

The model can be used to estimate the climatological mean SPA for any month and diurnal time period for any of the 556 available stations.

## APPENDIX A. PREDICTION MODEL TEST STATIONS

This appendix lists the stations used to develop and test the surface pressure altitude prediction model described in this report. The station number listed for each station is the World Meteorological Organization station number. Lat and Lon are the latitude and longitude of the station in degrees, respectively. Elev is the station elevation above mean sea level in meters.

Station Number	Station Name	Lat (deg)	Lon (deg)	Elev (m)

## **APPENDIX B. MODELLED STATION EFFECTS**

This appendix lists the 556 stations used in developing the pressure altitude prediction model and their corresponding contributions to the model (effects--c, d, and f). The units of all effects are meters.

Number: 24640 Name: STOCKHOLM/BROMMA, SN  
 Effect of Station Location (c): 26.302  
 Effect of Interaction of Station Location and Month (d):

Jan	Feb	Mar	Apr	May	Jun
18.832	-17.938	73.889	-19.367	-63.511	-29.866
Jul	Aug	Sep	Oct	Nov	Dec
-3.628	-34.943	-3.194	-14.434	39.780	54.382
